

Non-Decimal Units for L^AT_EX

Mikkel Eide Eriksen
`mikkel.eriksen@gmail.com`

October 4, 2023

1 Preface

Many historical unit systems were non-decimal. For example, the Danish rigsdaler¹ — where 1 rigsdaler consists of 16 mark, each again consisting of 16 skilling for a total of 96 skilling per rigsdaler — was used from 1625 to 1875, when currency was decimalised to the current system of 1 krone = 100 øre.

Units for such measures as length, area, weight, and so on were also often non-decimal, and in fact remain so in the few places of the world that have not made the change to the metric system.

The non-decimal numbers were chosen due to their larger number of division factors, which simplified mental arithmetic — eg. when sharing an amount of money or dividing goods.

This package enables creation and configuration of such units to facilitate their presentation in textual and tabular contexts, as well as simple arithmetic.

In order to do this, values are divided into *segments*, which are separated by decimal points: for example, the historical Danish monetary value 1 Rdl. 2 ~~ⷵ~~ 3 ⷶ is entered as `1.2.3`, which the code then formats appropriately.

Issues can be reported at <https://github.com/mikkelee/latex-units/issues> but keep in mind I am not very experienced with L^AT_EX;)

¹https://en.wikipedia.org/wiki/Danish_rigsdaler

2 Configuration

The package is configured in the following manner:

```
\usepackage[<options>]{non-decimal-units}
```

Where *<options>* may contain one or more of the following unit systems. See page 15 for details.

british Currencies
danish Currencies, areas, and weights
german Currencies

Alternately, one may configure new units via `\nduNewBaseUnit`^{→ P. 13} and `\nduNewUnitGroup`^{→ P. 13}.

```
\nduKeys{<options>}
```

Can be used to set options globally (in the preamble) or locally (in a group). See further documentation for possible keys/values.

3 Usage

3.1 Formatting Values

The central macro is `\nduValue`. It formats values for display and is configurable in a number of ways.

```
\nduValue{⟨unit group⟩}[⟨options⟩]{⟨value⟩}
```

Formats $\langle value \rangle$ according to the setup configured for the $\langle unit group \rangle$, as well as any provided $\langle options \rangle$.

If no special configuration is made, the number of decimal points and the values between them determine how many and which units are displayed. For example, empty segments are skipped unless the `replace nil withP.4` key is set.

Example usage: `\nduValue` macro

```
\nduValue{danish rigsdaler}{1.2.3}\\
\nduValue{danish rigsdaler}{1}\\
\nduValue{danish rigsdaler}{.2}\\
\nduValue{danish rigsdaler}{..3}\\
```

1 Rdl. 2 ~~z~~ 3 β
1 Rdl.
2 ~~z~~
3 β

3.1.1 Options

`display=values only`
`display=formatted` (initially `formatted`)
`display=symbols only`

Changes which information is included in the expansion.
 Because only those segments with a value will be included,
`display=symbols only` can be used to list the segment units
 (though if only one or two is needed, it may be preferable to use
`\nduSymbol`^{P.12}).

```
\nduValue{danish hartkorn}
  [display=symbols only]
  {0.0.0.0.0}

\nduValue{danish hartkorn}
  [display=values only]
  {0.0...}
```

Td. Sk. Fj. Alb. §
 0 0

`format={⟨...⟩}` (initially `⟨\VALUE\SYMBOL⟩`)

Sets how a given base unit should be formatted for display.
 The placeholders `\VALUE` and `\SYMBOL` will be substituted when the
 value is typeset.

`replace nil with=⟨...⟩` (no default, initially empty)
`treat zero as nil` (initially not set)

The key `replace nil with` replaces nil (empty) segments with a
 custom string.
 The key `treat zero as nil` replaces 0 with nothing, which in turn
 means that setting both will replace both zero and nil with the
 custom string.

`segment separator=<...>` (initially ~)

When displaying a value, this string will be inserted between each segment.

```
\nduValue{danish hartkorn}[
  display=values only,
  segment separator=.
]
{1.2.3.4}

\nduValue{danish rigsdaler}
[segment separator={---}]
{1.2.3}
```

1.2.3.4
1 Rdl.—2 ~~z~~—3 ð

`prefix=<...>` (no default, initially undefined)

`suffix=<...>` (no default, initially undefined)

When displaying a value, the output can be wrapped between *<prefix>* and *<suffix>*.

`unit depth=⟨unit name⟩` (initially no restriction)

When calculating or displaying a value, only the segments up to and including *⟨unit name⟩* will be considered.

In this document, the depth has been globally set to **skilling**, but older historical sub-units can be included by locally setting the depth to eg. **hvid** (or indeed not restricting it globally).

If the *⟨unit name⟩* is not present in the current unit group, it has no effect.

```
\nduValue{danish rigsdaler}  
[unit depth=skilling]  
{1.2.3.4.5}
```

```
\nduValue{danish rigsdaler}  
[unit depth=penning]  
{1.2.3.4.5}
```

1 Rdl. 2 ~~z~~ 3 β
1 Rdl. 2 ~~z~~ 3 β 4 Hv. 5 g

3.2 Tabular Data

In order to align values in a tabular context, the `aligned` key causes `\nduValue` to wrap each segment in a cell of equal width, using `\makebox`.

Additionally, the `\nduHeader` macro provides a convenient header showing the unit symbols.

All segments will be included in the headers and cells, whether they contain a value or not (provided `unit depth` allows it). If no value is provided for the segment, and no nil replacement is specified with the `replace nil with`^{→P.4} key, the cell will be empty.

`\nduHeader{⟨unit name⟩}[⟨options⟩]`

Formats the unit symbols in boxes suitable for a header. See page 13 for configuration of symbols.

Example of tabular data

```
\begin{group}
\nduKeys{
  aligned,
  treat zero as nil,
  replace nil with=---,
}
\begin{tabular}{r r}
\toprule
& \nduHeader{danish rigsdaler} \\
\midrule
a & \nduValue{danish rigsdaler}{1.2.3} \\
b & \nduValue{danish rigsdaler}{100.0.0} \\
c & \nduValue{danish rigsdaler}{.1.} \\
\bottomrule
\end{tabular}
\end{group}
```

	Rdl.	ℳ	β
a	1	2	3
b	100	—	—
c	—	1	—

3.2.1 Options

`aligned` (initially not set)
`set aligned for environment` (initially set for `tabular`)

Setting `aligned` will format the presently displayed header in aligned boxes, desirable in tabular contexts.

The `set aligned for environment` key can be set to an environment name, causing `aligned` to automatically be set for those environments, using `\AtBeginEnvironment`. It can be set multiple times, once for each required environment.

`cell width=<length>` (initially 3em)

Changes the width of each segment.

Example usage: `cell width` key

```
\begin{group}
\nduKeys{
  treat zero as nil,
  cell width=5em,
}
\begin{tabular}{r r}
\toprule
& \nduHeader{danish rigsdaler} \\
\midrule
a & \nduValue{danish rigsdaler}{1.2.3} \\
b & \nduValue{danish rigsdaler}{100..} \\
c & \nduValue{danish rigsdaler}{.1.} \\
\bottomrule
\end{tabular}
\end{group}
```

	Rdl.	⌘	β
a	1	2	3
b	100		
c		1	

3.3 Arithmetical Operations

Basic arithmetic functions can be used to build a result for display. Internally, this is done by converting the value to a representation, which is the total number of the smallest usable unit, eg. 1 Rdl. 2 ~~℥~~ 3 β is 131 skilling.

Results can be gathered in two ways, either manually via the `\nduMath` macro, or automatically via the `add to variable` and `subtract from variable` keys, the latter being especially suitable in tabular contexts.

```
\nduMath{⟨unit name⟩}[⟨options⟩]{⟨variable⟩}{⟨operator⟩}{⟨value⟩}  
\nduResult{⟨unit name⟩}[⟨options⟩]{⟨variable⟩}
```

The first arguments of `\nduMath` are identical to those of the `\nduValue→P.3` macro. In addition, it has $\langle variable \rangle$ and $\langle operator \rangle$ (one of `+` `-` `*` `/`) arguments. The first time a variable is used, it is assumed that the value is 0. The given value is then converted to its internal representation and stored in the variable. The command does not expand to any output.

Note that mixing units in the same variable is not currently supported, and will likely give incorrect results.

The `\nduResult` macro takes a stored $\langle variable \rangle$ and formats it for display in the same way as `\nduValue→P.3`.

Both may be further configured via the $\langle options \rangle$ in the same way as the other macros.

Note that the `treat zero as nil` key does not work for math results at present.

Example usage: `\nduMath` and `\nduResult` macros

```
\nduMath{danish rigsdaler}{example 1}{+}{0.0.10}
\nduMath{danish rigsdaler}{example 1}{+}{.8}
\nduMath{danish rigsdaler}{example 1}{+}{0.2}
\nduMath{danish rigsdaler}{example 1}{+}{0.5.1}
\nduResult{danish rigsdaler}{example 1} % = 1.2.3
```

1 Rdl. 2 ⌘ 3 β

Example usage: `\nduResult` macro

```
\nduHeader{danish rigsdaler} % TODO newlines????
\nduResult{danish rigsdaler}[aligned]{example 1}
```

Rdl.
 ⌘
 β
 1
 2
 3

3.3.1 Options

`add to variable=<...>`
`subtract from variable=<...>`

Setting either of these keys will cause all uses of `\nduValue` in the current group to be added to or subtracted from the variable with the given name.

Example usage: `add to variable` key

```
\begin{group}
\nduKeys{
  cell width=3em,
  replace nil with=---,
  add to variable=example 2
}
\begin{tabular}{r r}
\toprule
& \nduHeader{danish rigsdaler} \\
\midrule
a & \nduValue{danish rigsdaler}{1.2.3} \\
b & \nduValue{danish rigsdaler}{100.1.} \\
\bottomrule
total & \nduResult{danish rigsdaler}{example 2} \% = 101.3.3
\end{tabular}
\end{group}
```

	Rdl.	⌘	β
a	1	2	3
b	100	1	—
total	101	3	3

Results are global and remain accessible outside the group:

```
\nduResult{danish rigsdaler}{example 2}
```

101 Rdl. 3 ⌘ 3 β

Adding an additional 15 skilling to the existing result gives:

```
\nduMath{danish rigsdaler}{example 2}{+}{0.0.15}
\nduResult{danish rigsdaler}{example 2} \% = 101.4.2
```

101 Rdl. 4 ⌘ 2 β

`normalize` (initially not set)

Reformats an amount, which is useful for quick conversions.

Example usage: `normalize` key

```
100 skilling equal  
\nduValue{danish rigsdaler}[normalize]{..100} % 1.0.4
```

100 skilling equal 1 Rdl. 0 ~~4~~ 4 β

4 Accessing Information About Units

`\nduSymbol{<unit name>}`

Expands to the symbol of the given base unit.
Set by `units/<unit name>/symbolP. 14`.

`\nduFactor{<unit name>}{<unit name>}`

Expands to the conversion between two base units.
Set by `units/<unit name>/factorP. 14`.

That is, 1 `\nduSymbol{rigsdaler}` consists of
`\nduFactor{rigsdaler}{skilling} \nduSymbol{skilling}`.

That is, 1 Rdl. consists of 96 β .

5 Creating New Units

If the included units are not suitable, more can be created. Pull requests are also welcome at <https://github.com/mikkelee/latex-units>.

```
\nduNewBaseUnit{<unit name>}{<key/value pairs>}
```

See below for available settings.

```
\nduNewUnitGroup{<unit name>}[<key/value pairs>]{<ordered base  
units>}[<control sequence>]
```

In order for the math functions to work, the base units must at present all have a conversion path to the right-most unit, eg. if a unit group consists of base units A, B, C, there must be defined factors for $A \rightarrow B$ and $B \rightarrow C$. The factor $A \rightarrow C$ is optional; if not configured, an attempt to calculate and cache it will be made internally.

It is possible to create shortcut macros for commonly used $\langle unit name \rangle$ s with optional overriding options. These macros take the same arguments as the full $\backslash nduValue^{\rightarrow P.3}$ macro, except without the first argument (ie. the name of the unit).

```
\nduNewUnitGroup{my sletdaler}  
% [units/sletdaler/symbol={S\textsuperscript{dl}}] % TODO  
{sletdaler, ort, skilling}  
[\mySldl]  
\mySldl{1.2.3}
```

1 Sldl. 2 O. 3 β

5.0.1 Options For Base Units

`units/⟨unit name⟩/symbol=⟨symbol⟩`

Configures a symbol displaying the unit. This is used in `\nduHeader` and is also available via `\SYMBOL` when defining the `units/⟨unit name⟩/format` (see below).

`units/⟨unit name⟩/format={⟨prefix⟩}{⟨suffix⟩}`

Sets how a given base unit should be formatted for display. If none is given, the general top-level `format` key is used.

`units/⟨unit name⟩/factor=⟨integer⟩ ⟨unit name⟩`

The conversion factor of a segment is how many of the underlying segment the given segment consists of.

This is used in the math macros, in order to calculate the correct segment values.

Can be accessed via `\nduFactor`^{→ P. 12}.

These keys can of course also be set temporarily in `\nduValue`^{→ P. 3}

```
\nduValue{danish rigsdaler}
[units/mark/symbol=Mk.]
{.9.}

\nduValue{danish rigsdaler}
[units/rigsdaler/format={\VALUE-Rigsdaler og}]
{1.2.3}

\nduValue{danish rigsdaler}[
  segment separator={---},
  units/rigsdaler/format={(\VALUE)},
  units/mark/format={[\VALUE]},
  units/skilling/format={\{ \VALUE \}},
]
{1.2.3}
```
