# Non-Decimal Units for LATEX

Mikkel Eide Eriksen mikkel.eriksen@gmail.com

October 3, 2023

#### 1 Preface

Many historical unit systems were non-decimal. For example, the Danish rigsdaler — where 1 rigsdaler consists of 16 mark, each again consisting of 16 skilling for a total of 96 skilling per rigsdaler — was used from 1625 to 1875, when currency was decimalised to the current system of 1 krone = 100 øre.

Units for such measures as length, area, weight, and so on were also often non-decimal, and in fact remain so in the few places of the world that have not made the change to the metric system.

The non-decimal numbers were chosen due to their larger number of division factors, which simplified mental arithmetic — eg. when sharing an amount of money or dividing goods.

This package enables creation and configuration of such units to facilitate their presentation in textual and tabular contexts, as well as simple arithmetic.

In order to do this, values are divided into *segments*, which are separated by decimal points: for example, the historical Danish monetary value 1 Rdl. 2  $\slash$  3  $\slash$  is entered as 1.2.3, which the code then formats appropriately.

Issues can be reported at https://github.com/mikkelee/latex-units/issues but keep in mind I am not very experienced with LATFX;)

 $<sup>^{1} \</sup>verb|https://en.wikipedia.org/wiki/Danish_rigsdaler|$ 

# 2 Configuration

The package is configured in the following manner:

#### $\usepackage[\langle options \rangle] \{ non-decimal-units \}$

Where  $\langle options \rangle$  may contain one or more of the following unit systems. See page 15 for details.

```
british Currencies
danish Currencies, areas, and weights
german Currencies
```

Alternately, one may configure new units via  $\ndvarphi$  and  $\ndvarphi$  and  $\ndvarphi$  and  $\ndvarphi$  and  $\ndvarphi$ .

#### 

Can be used to set options globally (in the preamble) or locally (in a group). See further documentation for possible keys/values.

## 3 Usage

#### 3.1 Formatting Values

The central macro is \nduValue. It formats values for display and is configurable in a number of ways.

### $\verb|\nduValue|{|\langle unit\ group\rangle}| [\langle options\rangle] | |\langle value\rangle| |$

Formats  $\langle value \rangle$  according to the setup configured for the  $\langle unit group \rangle$ , as well as any provided  $\langle options \rangle$ .

If no special configuration is made, the number of decimal points and the values between them determine how many and which units are displayed. For example, empty segments are skipped unless the  $\mathtt{replace}$  nil  $\mathtt{with}^{\to P.4}$  key is set.

```
Example usage: \nduValue macro
\nduValue{danish rigsdaler}{1.2.3}\\
\nduValue{danish rigsdaler}{1}\\
\nduValue{danish rigsdaler}{.2}\\
\nduValue{danish rigsdaler}{..3}\\

1 Rdl. 2 \( \alpha \) 3 \( \beta \)
1 Rdl. 2 \( \alpha \) 3 \( \beta \)
2 \( \alpha \)
3 \( \beta \)
```

#### 3.1.1 Options

```
display=values only
display=formatted
display=symbols only
(initially formatted)
```

Changes which information is included in the expansion.

Because only those segments with a value will be included, display=symbols only can be used to list the segment units (though if only one or two is needed, it may be preferable to use \nduSymbol^P.12).

```
\nduValue{danish hartkorn}
[display=symbols only]
{0.0.0.0.0}

\nduValue{danish hartkorn}
[display=values only]
{0.0...}

Td. Sk. Fj. Alb. §
0 0
```

Sets how a given base unit should be formatted for display. The placeholders  $\VALUE$  and  $\SYMBOL$  will be substituted when the value is typeset.

The key replace nil with replaces nil (empty) segments with a custom string.

The key treat zero as nil replaces 0 with nothing, which in turn means that setting both will replace both zero and nil with the custom string.

```
When displaying a value, this string will be inserted between each segment.

\[ \nduValue{\danish hartkorn}[ \ display=values only, \ segment separator=. \]
\[ \lambda \lambd
```

```
\begin{array}{ll} \mathbf{prefix=}\langle ... \rangle & \text{(no default, initially undefined)} \\ \mathbf{suffix=}\langle ... \rangle & \text{(no default, initially undefined)} \end{array}
```

When displaying a value, the output can be wrapped between  $\langle \textit{prefix} \rangle$  and  $\langle \textit{suffix} \rangle.$ 

```
unit depth=\langle unit \ name \rangle
```

(initially no restriction)

When calculating or displaying a value, only the segments up to and including  $\langle unit\ name \rangle$  will be considered.

In this document, the depth has been globally set to skilling, but older historical sub-units can be included by locally setting the depth to eg. hvid (or indeed not restricting it globally).

If the  $\langle unit\ name \rangle$  is not present in the current unit group, it has no effect.

```
\nduValue{danish rigsdaler}
[unit depth=skilling]
{1.2.3.4.5}
\nduValue{danish rigsdaler}
[unit depth=penning]
{1.2.3.4.5}

1 Rdl. 2 & 3 &
1 Rdl. 2 & 3 & 4 Hv. 5 &
```

#### 3.2 Tabular Data

In order to align values in a tabular context, the aligned key causes \nduValue to wrap each segment in a cell of equal width, using \makebox.

Additionally, the \nduHeader macro provides a convenient header showing the unit symbols.

All segments will be included in the headers and cells, whether they contain a value or not. If no value is provided for the segment, and no nil replacement is specified with the replace nil with P.4 key, the cell will be empty.

#### $\label{local_norm_norm_norm_norm} \$

Formats the unit symbols in boxes suitable for a header. See page 13 for configuration of symbols.

```
\begingroup
\nduKeys{
  treat zero as nil,
  replace nil with=---,
  display=values only,
  set aligned for environment=tabular,
\begin{tabular}{r r}
  \toprule
  & \nduHeader{danish rigsdaler} \\
  \midrule
  a & \nduValue{danish rigsdaler}{1.2.3} \\
  b & \nduValue{danish rigsdaler}{100.0.0} \\
  c & \nduValue{danish rigsdaler}{.1.} \\
  \bottomrule
\end{tabular}
\endgroup
        Rdl.
                 2
 a
         100
                 1
 ^{\rm c}
```

### **3.2.1** Options

Setting aligned will format the presently displayed header in aligned boxes, desirable in tabular contexts.

The set aligned for environment key can be set to an environment name, causing aligned to automatically be set for those environments, using \AtBeginEnvironment. It can be set multiple times, once for each required environment.

```
cell width=\langle length \rangle (initially 3em)
```

Changes the width of each segment.

```
begingroup
\nduKeys{
   treat zero as nil,
   display=values only, % TODO auto display=values only in aligned mode?
   cell width=5em,
}
\begin{tabular}{r r}
   \toprule
    & \nduHeader{danish rigsdaler} \\
   \midrule
        a & \nduValue{danish rigsdaler}{1.2.3} \\
        b & \nduValue{danish rigsdaler}{1.1.} \\
   bottomrule
   \hottomrule
\end{tabular}
\endgroup
```

	Rdl.	<b>≯</b>	ß
a	1	2	3
b			100
c			1

#### 3.3 Arithmetical Operations

Basic arithmetic functions can be used to build a result for display. Internally, this is done by converting the value to a representation, which is the total number of the smallest usable unit, eg. 1 Rdl. 2  $\nearrow$  3  $\upbeta$  is 131 skilling.

Results can be gathered in two ways, either manually via the \nduMath macro, or automatically via the add to variable and subtract from variable keys, the latter being especially suitable in tabular contexts.

 $\label{eq:local_$ 

The first arguments of \nduMath are identical to those of the \nduValue  $^{\rightarrow P.3}$  macro. In addition, it has  $\langle variable \rangle$  and  $\langle operator \rangle$  (one of + - \* /) arguments. The first time a variable is used, it is assumed that the value is 0. The given value is then converted to its internal representation and stored in the variable. The command does not expand to any output.

Note that mixing units in the same variable is not currently supported, and will likely give incorrect results.

The  $\nderight \nderight \nderight$ 

Both may be further configured via the  $\langle options \rangle$  in the same way as the other macros.

Note that the treat zero as nil key does not work for math results at present.

### Example usage: \nduMath and \nduResult macros

1 Rdl. 2 ≱ 3 ß

#### Example usage: \nduResult macro

```
\nduHeader{danish rigsdaler} % TODO newlines?????
\nduResult{danish rigsdaler}[aligned]{example 1}
```

```
Rdl.

⅓

⅓

1 Rdl.

2 ⅓

3 ß
```

#### 3.3.1 Options

```
add to variable=\langle ... \rangle subtract from variable=\langle ... \rangle
```

Setting either of these keys will cause all uses of  $\ndvalue$  in the current group to be added to or subtracted from the variable with the given name.

```
Example usage: add to variable key
\begingroup
\nduKeys{
  cell width=3em,
 replace nil with=---,
  add to variable=example 2
\begin{tabular}{r r}
  \toprule
  & \nduHeader{danish rigsdaler} \\
  \midrule
  a & \nduValue{danish rigsdaler}{1.2.3} \\
  b & \nduValue{danish rigsdaler}{100.1.} \\
  \bottomrule
  total & \nduResult{danish rigsdaler}{example 2} \\ % = 101.3.3
\end{tabular}
\endgroup
         Rdl.
       1 Rdl.
              2 ≱
                    3 ß
       100 Rdl. 1 ≱
       101 Rdl. 3 ≱
 total
```

Results are global and remain accessible outside the group:

```
\nduResult{danish rigsdaler}{example 2}

101 Rdl. 3 & 3 &
```

Adding an additional 15 skilling to the existing result gives:

```
\nduMath{danish rigsdaler}{example 2}{+}{0.0.15}
\nduResult{danish rigsdaler}{example 2} % = 101.4.2
101 Rdl. 4 & 2 \beta
```

```
Reformats an amount, which is useful for quick conversions.

Example usage: normalize key

100 skilling equal
\nduValue{danish rigsdaler}[normalize]{..100} % 1.0.4

100 skilling equal 1 Rdl. 0 & 4 ß
```

## 4 Accessing Information About Units

```
Expands to the symbol of the given base unit.

Set by units/\(\langle unit name \rangle \rangle \symbol^{\top.14}\).

\[ \langle \text{name} \rangle \langle \langle unit name \rangle \rangle \]

Expands to the conversion between two base units.

Set by units/\(\langle unit name \rangle \rangle \factor^{\top.14}\).

That is, 1 \(\text{nduSymbol}\rangle \rangle \text{rigsdaler} \rangle \text{consists of } \\ \nduSymbol \rangle \rangle \rangle \rangle \text{nduSymbol}\rangle \rangle \
```

## 5 Creating New Units

If the included units are not suitable, more can be created. Pull requests are also welcome at https://github.com/mikkelee/latex-units.

```
\label{localization} $$ \\displaystyle \operatorname{name} \ | \langle key/value = pairs \rangle ] {\langle ordered = base | units \rangle} [\langle control | sequence \rangle] $$
```

In order for the math functions to work, the base units must at present all have a conversion factor to the right-most unit, eg. if a unit group consists of base units A, B, C, there must be defined factors for  $A \rightarrow C$  and  $B \rightarrow C$ . The factor  $A \rightarrow B$  is optional, as it is not used in the internal calculations for this unit group.

It is possible to create shortcut macros for commonly used  $\langle unit name \rangle$ s with optional overriding options. These macros take the same arguments as the full  $\del{lue}^{P.3}$  macro, except without the first argument (ie. the name of the unit).

```
\nduNewUnitGroup{my sletdaler}
% [units/sletdaler/symbol={S\textsuperscript{dl}}] % TODO
    {sletdaler, ort, skilling}
    [\mySldl]
\mySldl{1.2.3}
1 Sldl. 2 O. 3 $\\(\beta\)
```

#### 5.0.1 Options For Base Units

```
units/\langle unit \ name \rangle/symbol=\langle symbol \rangle
```

Configures a symbol displaying the unit. This is used in  $\ndelta_{name}$  and is also available via  $\slashed_{name}$  when defining the units/ $\alpha_{name}$ /format (see below).

```
units/\langle unit\ name \rangle/format={\langle prefix \rangle}{\langle suffix \rangle}
```

Sets how a given base unit should be formatted for display. If none is given, the general top-level **format** key is used.

```
units/\(\langle unit name \rangle \)/factor=\(\langle integer \rangle \) \(\langle unit name \rangle \)
```

The conversion factor of a segment is how many of the underlying segment the given segment consists of.

This is used in the math macros, in order to calculate the correct segment values.

Can be accessed via \nduFactor \(^{\text{P.}12}\).

These keys can of course also be set temporarily in \nduValue<sup>→P.3</sup>

```
\nduValue{danish rigsdaler}
  [units/mark/symbol=Mk.]
  {.9.}
\nduValue{danish rigsdaler}
  [units/rigsdaler/format={\VALUE~Rigsdaler og}]
  {1.2.3}
\nduValue{danish rigsdaler}[
   segment separator={---},
   units/rigsdaler/format={(\VALUE)},
   units/mark/format={[\VALUE]},
   units/skilling/format={\{\VALUE\}},
 ]
  {1.2.3}
9 Mk.
(1)—[2]—\{3\}
```

## 6 Included Units

On the following pages are the units included with the package.

```
Listing of units loaded with the british option
